                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Submitted (11-MAR-2002) Ceres, Inc, 3007 Malibu Canyon Road, Malibu, CA 90265, USA

This clone sequence is one of 5,000 Ceres full-length cDNAs made available to TIGR and Genbank. The following quality assessment of this set was done by comparison with known proteins: two percent this set was done by comparison with known proteins: two percent the clones are estimated to be 5'-truncated; less than one percent are 3'-truncated; approximately two percent represent alternative splice variants, including unspliced introns and spliced exons; one percent may contain premature stop codons; five percent may have frame shifts in a coding region. A sequence is considered to be 5'-truncated if it lacks the translation initiation start (ATG). A sequence is considered to be 3'-truncated if it lacks the crocked protein. Please note that these cDNA sequences are derived from the Ws or Laber ecotypes and therefore may contain polymorphisms when compared to sequences from Col-0. Genset carried out the library production and sequences from Col-0. Location/Qualifiers

The present invention relates to an isolated nucleic acid molecule encoding a cell proliferation-related polypeptide. The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related nucleic acid sequence. The present sequence is published separately from the main body of the specification as EPO data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cell proliferation related polypeptide; cell proliferation; senescence; differentiation; stress response; ds.

                                                                                                                                                                                                                            The present sequence encodes a E2F-dimerisation partner (DP) protein. The protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to S phase of the cell cycle, and later, the expression of genes required for S-phase progression. E2F and retinoblastoma protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblastoma protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F DNA binding shape, and particularly to alter cell proliferation characteristic such as to alter plant cell, organ or tissue so to alter plant cell, organ or tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180

```

New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.

WPI; 2004-330163/30. P-PSDB; ADO63083.

Claim 1; SEQ ID NO 1549; 510pp; English.

tungal disease and particularly Expsiphe, Fusarium and Botrytis, increased tolerance to multiple fungal pathogens, increased resistance to glyphosate, increased sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, increased sensitivity to ABA, reduced sensitivity to ABA, increased sensitivity to ACC, altered sensing, increased tolerance to sugars, altered flower structure, loss of flowering, latered flower structure, loss of flowering, altered shoot meristem development, altered branching pattern, altered stem morphology, altered velopment, altered branching pattern, altered trichome structure, altered sensitivity, altered sed sed apical dominance, altered trichome density, altered trichome development, altered sed call proliferation, altered sed development, altered sed sed call proliferation, altered sed sed development, altered sed dipase change, altered sensecence, abnormal embryo development, altered programmed cell called sensescence, abnormal embryo development, altered plants, increased cell prices, altered branching, altered plants, death, lethality when overexpressed, altered necrosis patterns, increased call are, increased blomass, large seedlings, dwarfed plants, green leaves, change in leaf shape, increased leaf size and mass, light green cr gray leaves, altered seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed sed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large seed shape, large see decréased anthocyanin levels. Note: The sequence data for this patent did The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (ADO61534-ADO63778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress, increased tolerance to osmotic stress, increased tolerance to cold, increased germination in cold, increased tolerance to heat, increased germination in heat, increased tolerance to freezing conditions, increased tolerance to low nitrogen conditions, increased tolerance to low phosphate conditions, increased tolerance to seed, increased leaf wax, increased leaf fatty acids, altered seed oil content, altered seed brotein content, altered seedprenyl content, altered leaf prenyl lipid content, increased anthocyanin levels, and form part of the printed specification, but was obtained in from WIPO at

Sequence 1158 BP; 374 A; 261 C; 253 G; 270 T; 0 U; 0 Other;

The present invention relates to novel plant transcription factor proteins (I) and nuclectide sequences (II) (ADO6154-ADO6179). The equences can be used to produce transgenic plants which overexpress (II), where the transgenic plant has an altered trait as compared to a control of the transgenic plant comprises on non-transgenic plant of the transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress, increased tolerance to cold, increased tolerance to cold, increased tolerance to cold, increased tolerance to cold, increased tolerance to conditions, increased tolerance to disease, increased tolerance to mitrogen conditions, increased tolerance to disease, increased tolerance to multiple fungal pathogens, increased tolerance to multiple fungal pathogens, increased tolerance to glyphosate, increased sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABC, altered sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABA, reduced density, altered to ABA, altered sensitivity to ABA, reduced density, altered send trichome structure, altered sensitivity to ABA, altered send fored plants, altered send fored plants, altered sensitivity to ABA, altered sensitivity to ABA, altered sensitivity to ABA, altered sensitivity to ABA, altered sensitivity sensitivity and 
                                                                                                                                                                                                                                                                                                                                                 New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                    Reuber TL;

```
The present invention relates to novel plant transcription factor

proteins (I) and nucleotide sequences (II) (AD061534-AD063778). The

sequences can be used to produce transgenic plants, which overexpress

(II), where the transgenic plant has an altered trait as compared to a

contransgenic plant or wild-type plant. The transgenic plant comprises

constraints selected from increased tolerance to abiotic stress,
increased germination in cold, increased tolerance to heat, increased

concreased germination in cold, increased tolerance to heat, increased

concreased germination in cold, increased tolerance to heat, increased

concreased tolerance to low nitrogen conditions, increased tolerance to

concreased tolerance to low nitrogen conditions, increased tolerance to

concreased tolerance to multiple fungal pathogens, increased tolerance to

concreased tolerance to multiple fungal pathogens, increased tolerance

concreased sensitivity to ABC, altered sugar sensing, increased tolerance

concreased sensitivity to ABC, altered sugar sensing, increased tolerance

concreased sensitivity to ABC, altered sugar sensing, increased tolerance

concreased sensitivity to ABC, altered sugar sensing, increased tolerance

concreased sensitivity to ABC, altered sugar sensing, increased tolerance

concreased sensitivity to ABC, altered sugar sensing, increased tolerance

concreased sensitivity to ABC, altered sensing, early flower determinacy, reduced

fertility, altered shoot meristem development, altered branching pattern,

concreased stem morphology, altered vascular tissue structure, altered seed development, altered seed development, altered seed development, altered call definentiation,

altered trichome structure, altered vascular tissue structure, altered seed development, altered cell definentiation,

altered call proliferation, altered cell expansion, altered seed of development, altered seed development, altered seed development, altered seed cell expansion, altered senses cence altered senses cence altered sense cence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel plant transcription factor proteins (1) and nucleotide sequences (11) (AD061534-AD063778). The sequences can be used to produce transgenic plants, which overexpress (CI), where the transgenic plant has an altered train secondared to a non-transgenic plant or wild-type plant. The transgenic plant comprises or non-transgenic plant or wild-type plant. The transgenic plant comprises or non-transgenic plant or wild-type plant. The transgenic plant comprises or non-transgenic plant or wild-type plant. The transgenic plant comprises or non-transgenic plant or wild-type plant. The transgenic plant comprises or non-transgenic plant or wild-type plant. The transgenic plant compliance or off confidence or cold, increased tolerance to deceased tolerance to cold, increased deceased tolerance to decease deceased tolerance to low phosphate conditions, increased tolerance to maltiple fungal pathogens, increased tolerance to multiple fungal pathogens, increased tolerance to glyphosate, increased sensitivity to ACC, altered sugar sensing, increased resistance to glyphosate, altered carbon/nitrogen sensing, early flowering, late flower studied sensitivity to ACC, altered sugar sensing, increased tolerance to sugars, altered darbon/nitrogen sensing, early flowering, latered flower studied wevelopment, altered branching pattern, altered altered trichome erroture, ratered vevelopment, altered development, altered development, altered coll dominance, altered trichome density, altered coll dominance, altered trichome density, altered coll dominance, altered trichome density, altered coll proliferation, altered coll development, altered seed development, altered seed coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered coll proliferation, altered

The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related nucleic acid sequence. The present sequence is published separately from the main body of the specification as EPO data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  22 HisileLeuGluAlaSerSerValProProLeuProGluAlaGlyGlyAsnAlaValGln 41

New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators.

Claim 38; Page 185-186; 316pp; English.

The invention relates to a novel cell cycle protein (CCP) and the polynucleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the copyapptide and which binds to the polypeptide and which binds to the copyapptide and which binds to the copyapptide and which binds to the copyapptide and anti-CCP antibody is useful for medulating the cell cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, maize, tomato, alfalfa, oilseed rape, soybean, sunflower and canola. CC nucleic acid and polypeptide molecules are useful as modulating agents in cegniating cell cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of CCP protein or production of CCP protein forms which have decreased or observant activity. Compounds that bind to or modulate the activity of CCP polymucleotide are useful for modifying cell fate, plant development, of polymucleotide is useful for modifying cell fate, plant development, of plant morphology, blochemistry and/or physiology, the length of the CCP plant morphology, blochemistry and/or physiology, the length of the CCP companies or all plants, initiation, promoction, stimulation or enhancement of cell division, DNA replication, promoction, stimulation and/or development, nodule function, dwarfism in plants, compacted and activity of a protein involved in the cell cycle due to protein levels or activity of a protein involved in the cell cycle due to protein levels or activity of a protein involved in the cell cycle due to protein levels or activity of a protein involved in the cell cycle due to protein levels or activity of a protein involved in the cell cycle due to plant architecture, plant quality traits, plant reproduction and seed development, endereduage cells, serons enderedual or address protein in storage cells, and attenuate or address protein in storage cells, and immuned or and repress such as immuned or an immuned or an immuned or an storage organs of plants or its parts. CCP is useful as an immunogen to generate antibodies. CCP protein is useful to screen for naturally cocurring CCP substrates. The polynucleotide is useful for expressing CCP protein, to detect CCP mRNA, or a genetic lesion in a CCP gene and to modulate CCP activity. The present sequence encodes a CCP protein of the Invention

New nucleic acid molecule encoding a cell proliferation-related polypeptide, useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. 

Claim 3; SEQ ID NO 13; 408pp; English.

modulating cell proliferation, sensocence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related nucleic acid sequence. The present sequence is published separately from the main body of the specification as EPO data. encoding a cell proliferation-related polypeptide. The nucleic acid molecule and the encoded polypeptide, and methods are useful for The present invention relates to an isolated nucleic acid molecule

The present sequence encodes a corn DP (not defined) polypeptide. The polypeptide is a transcription factor that activates transcription of numerous genes involved in DNA replication, thus playing a role in the G1 to 8 transition in the cell cycle. Do, also called DRTF (differentiation regulated transcription factor 1) has been shown to form specific multiprotein complexes with the retinoblastoma susceptibility protein, plo7, cyclins and cdk2. The DP polynuclecide was used to produce a transgenic plant. The DP nucleic and proteins are useful for increasing transformation efficiency in plants by increasing the number of dividing cells in the plant (dividing cells may be more receptive to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  69

The invention relates to a novel cell cycle protein (CCP) and the compound which modulates the activity of the polypeptide and which binds to the polypeptide and anti-CCP antibody is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and anti-CCP antibody is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thaliand, rice, wheat, maize, tomato, alfalfa, oilseed rape, soybean, sunflower and canola. CCP nucleic acid and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat to requisite the production of CCP protein or production of CCP protein forms which have decreased or obstrat activity. Compounds that bind to or modulate the activity of CCP polypeptide are useful as herbicides or plant growth regulators. The polypeptide are useful as herbicides or plant growth regulators. The polypeptide are useful for modifying cell fate, plant development, plant morphology, biochemistry and/or physiology, the length of the G1, S, G2 and/or M phase of the cell cycle of a plant, initiation, promotion, stimulation or enhancement of cell division, DNA replication, shoot and root initiation and/or development, nodule function, dwarfism in plants, containtibody are useful in agriculture to modulate the protein levels or activity of a protein involved in the cell cycle due to environmental conditions, including abiotic stress such as cold, nutrient deprivation, heat, drought, all stress, or biotic stress such as cold, nutrient pathogenent, endoredupleate e.g. enhance crop yields, and attenuate plant quality raits, plant reproduction and seed development, endoredupleate e.g. enhance crop yields, and attenuate pathogenent, endoredupleate e.g. enhance crop yields, and attenuate plant quality traits, plant gernage cells, storage tissues and/or development, endoredupleate are protein involved in the cell cycle pathogen are correct or generate antiboddes. CCP protein is usef
                                                                                                                                                                                                         New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    occurring CCP substrates. The polynucleotide is useful for expressi protein, to detect CCP mRNA, or a genetic lesion in a CCP gene and modulate CCP activity. The present sequence encodes a CCP protein o

This is the nucleotide sequence of a contig assembled from the CDNA inserts in clones p0005.cbmfh22r, cdelc.pk001.j13 and cen3n.pk0183.bi. It encodes a portion (see AAY32164) of a corn protein that shows homology to human cell cycle regulatory protein DP-2. The deduced amino acid sequence of this cDNA represents 50% of the middle region of the DP-2 protein. The coff contact of this cDNA represents 50% of the middle region of the DP-2 protein. The contact of the analysis of the middle region of the DP-2 protein. The contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the chimeric gene encoding all or a portion of the contact of the chimeric gene regults in product on of altered levels of the cell cycle regulatory protein, in sense or antisense ortentation, where cycle regulatory protein, in sense or antisense of cell cycle regulatory protein in a transformed host cell. The nucleic contact in plants, provide genetic tools to enhance cell growth in cycle regulation in plants, provide genetic tools to enhance cell growth in transformations. The proteins may also provide targets to facilitate contact of design and/or identification of cell cycle regulations. The proteins may also provide targets to facilitate contact of design and/or identification of cell cycle regulatory proteins may also provide targets to facilitate contact of design and/or identification of cell cycle regulatory proteins that may contact of the useful as herbicides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         332

plant morphology, biochemistry and/or physiology, the length of the G1, S G2 and/or M phase of the cell cycle of a plant, initiation, promotion, stimulation or enhancement of cell division, DNA replication, seed set, seed size, seed development, tuber, fruit, leaf formation, shoot and root initiation and/or development, nodule function, dwarfism in plants, senescence, tolerance or resistence to stress. CCP, the polyvucteotide and the anti-CCP antibody are useful in agriculture to modulate the protein levels or activity of a protein involved in the cell cycle due to protein levels or activity of a protein involved in the cell cycle due to convironmental conditions, including abiotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or biotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or biotic stress such as cold, nutrient cell plant activity traits, plant reproduction and seed development, endoreduplication in storage cells, storage tissues and/or storage organs of plants or its parts. CCP is useful as an immunogen to generate antibodies. CCP protein is useful to screen for naturally occurring CCP substrates. The polynucleoside is useful for expressing CCP protein, to detect CCP mRNA, or a genetic lesion in a CCP gene and to modulate CCP activity. The present sequence encodes a CCP protein of the

The invention relates to a novel cell cycle protein (CCP) and the polynucleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for modulating the cell card of company affaits, oilseed rape, soybean, sunflower and canola. CCP uncleic acid and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP polypeptide are useful as herbicides or plant growth regulators. The polymentide is useful for modifying cell fate, plant development,

New cell cycle protein and nucleic acid molecule encoding it useful fregulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators.

// plants were grown in the greenhouse at the University of callifornia, Riverside from each pool, equal quantities of all three RNA was preparations of the Totor of Callifornia, Riverside
// phagemids were plated and picked at the Clemson University Genomics Institute (CUG1) (Begum, Palmer, Frisch, Atkins and Wing) Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUG1 (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main): The Sequence has been trimmed to remove vector sequence analysis see hitto://www.genome. /note="Organ: Apical meristem and tissues surrounding of mature plants, Vector: pSport1; Site_1: Sal1; Site_2: Mot1; An unidirectional cDNA library generated from fApical meristem and tissues surrounding of mature plants]. cDNA was prepared from polyA+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BE511883 548 bp mRNA linear EST 07-AUG-2000 946064A10.yl 946 - tassel primordium prepared by Schmidt lab Zea

/note=Torgan: Developing inflorescence and rachis /note=Torgan: Developing inflorescence and rachis (10cm-long); Vector: pSport!; Site 1: Sall; Site 2: Not!; An unidirectional cDNA library generated from [Developing inflorescence and rachis (10cm-long)]. CDNA was prepared from polyA+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AACTTATCGTTGTAGTTTGATGAGAATATCAGGAGGAGGAGGTGTATGATGCTTTTAAT 482

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Web: www.genoscope.cns.fr)
The sequences are based on single pass reads.
Life Technologies (a division of Invitrogen) members carried out full-length librairies construction: Temple G. Genoscope members carried out sequencing and annotation: Castell V. Aury J.M., Jaillon O., Wincker P., Menard M., Cruaud C., Schachter V., Weissenbach J., Salanoubat M.
URGV INRA: Clepet C., Caboche M.
Annotation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences). 5 prime and 3 prime are assembled with Phrasic payer.

The sequences are based on single pass reads.

Life Technologies (a division of Invitrogen) members carried out full-length libraries construction : Temple G. Genoscope members carried out sequencing and annotation : Castelli V., Aury J.M., Jaillan O., Wincker P., Menard M., Cruaud C., Schachter V., Weissenbach J., Salmoubat M.

URGV INRA : Clepet C., Caboche M.

Annotation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences). 5 prime and 3 prime are assembled with Phrap.

If you are interested in getting corresponding physical clones,
If you are interested in getting corresponding physical clones,
these are publicly available from ZmDB and may be found by BLAST
searching at MSL, maizemap.org; ZmDB, www.zmdb.iastate.edu; TIGR,
www.tigr.org; or NCBI, www.ncbi.nlm.nih.gov. When the source of the
maize cDNA sequences is either Virginia Walbot, Stanford or Pat
Schnable, Lowa State, then clones may be requested from ZmDB:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HTC 16-OCT-2002
